

Save Money by Reducing your Energy Costs!

Energy costs are at an all time high.

Valcom's Engineered Services' IP 6000 System™ can reduce those costs by utilizing an easy to use browser based schedule to automatically switch building systems off and on. This allows schools to manage high energy consuming devices such as lighting and climate control systems.

A very common application of this unique functionality is turning hallway lighting off during class periods.

Listed below are some examples of how the IP6000 System can help schools save money by reducing their energy cost.

- Turn off lights in common areas during class periods
- Turn off unnecessary exterior lighting in late evening
- Activate timers for bus block heater circuits
- Cycle power to climate control systems
- Turn off lighting in school display cases
- Turn off decorative lighting at night

Smart energy control is a key component of effective budget management.

Let the Class Connection IP6000 start saving your school money today!
